Re: Black-Cockatoo habitat assessment for the Waddi Wind Farm transmission line alignment and the nominated areas in the adjacent farmland

Dear Giles

Terrestrial Ecosystems is pleased to provide the results of its Black-Cockatoo habitat survey and assessment for the alternative transmission line alignment and the nominated areas in the adjacent farmland for the Waddi Wind Farm (i.e. project area; Figure A).

Project area

The total project area was spread over eight farming properties (i.e. Ejeed Pty Ltd, Warra Warra Farming Pty Ltd, Enid, Jakob and Annalise, Tekymbah Trust, Bias Holdings Pty Ltd, John Walter Demer) and Crown Reserve 41986 / Conservation Park.

Terrestrial Ecosystems was requested to undertake a Black-Cockatoo habitat assessment, including a search for evidence of Black-Cockatoo foraging and a 'tall trees' survey.

The project area is mostly paddocks to grow cereal crops, with some paddocks having planted trees as wind breaks or to provide protection for stock, or roadside verges. The project area also included an area to the west for a possible transmission power line that would run through kwongan heathland and woodland dominated by proteaceous plant species such as *Banksia* spp. (including *Dryandra* spp.), *Hakea* spp. and *Grevillea* spp.

Methods

The project area was assessed on two occasions:

- on foot, 4WD vehicle and using a Utility-Terrain Vehicle (UTV) on 14 and 15 October 2021; and
- on foot and 4WD vehicle on 28 October 2022.

Prior to attending the project area, RPS AAP Consulting had contacted all of the property owners seeking permission for Terrestrial Ecosystems to enter their properties. Within 24 hours of commencing the survey, Terrestrial Ecosystems contacted all owners except for Enid, Jakob and Annalise Duschka who did not answer their phone nor return left messages for the first visit.

Terrestrial Ecosystems assessed all vegetation (excluding planted crops, and paddocks cleared or left as fallow) using the foraging habitat categories as described in the Department of Water, Agriculture and the Environment's (2022) referral guidelines. Table 1 indicates the referral thresholds contained in this document. There is a scoring system for determining the quality of foraging habitats that accompanies this table and that has been reproduced as Appendix A.

Table 1. Foraging habitat categories for Carnaby's Cockatoo (taken from Table 1A of Department of Water, Agriculture and the Environment's (2022) referral guidelines*

Attribute	Referral threshold
Breeding	Any loss of / impact upon known, suitable or potential nesting trees, and the habitat around these trees, is highly likely to require a referral to the minister. Loss of any potential nesting habitat is likely to require a referral to the minister.
High-quality native foraging habitat	Loss of greater than or equal to 1 ha of foraging habitat scoring 5-10 using the foraging quality scoring tool is likely to require referral to the minister. Foraging habitat quality is determined using the foraging quality scoring tool and takes into account context i.e. proximity of the impact site to important attributes.
Lower-quality native foraging habitat	Loss of greater than or equal to 10 ha of foraging habitat scoring 0-4 using the foraging quality scoring tool is likely to require referral to the minister. Foraging habitat quality is determined using the foraging quality scoring tool and takes into account context i.e. proximity of the impact site to important attributes.
Exotic foraging habitat	Loss of greater than or equal to 1 ha of predominantly exotic habitat (e.g. Cape Lilac trees and pine trees) known to be utilised by black cockatoos is likely to require a referral to the minister.
Night roosting habitat	Removal of any part of a known night roosting site is likely to require referral to the minister.

* The foraging scoring tool is reproduced in Appendix A

To undertake this assessment Terrestrial Ecosystems traversed each of the areas, noting the vegetation type and estimating the height of the upper stratum. The GPS location of all tall trees were recorded (except for pine trees) and a search was completed for evidence of past or recent Black-Cockatoo foraging. All potential Black-Cockatoo breeding trees (i.e. eucalypts with a diameter at breast height of $\geq 50\text{cm}$) had their DBH measured and any eucalypt trees with hollows of suitable dimensions for a Black-Cockatoo nesting site were noted and the hollow(s) dimensions recorded.

For the purposes of this assessment, 'tall trees' were defined as typically having one or more vertical trunks, not sprouting from the base and being $\geq 8\text{m}$ tall, except for Coastal Blackbutt where the height was typically $\geq 6\text{m}$. Most of the pine trees met the criteria, however, although they can provide a foraging resource for Black-Cockatoos, they do not form hollows and therefore do not provide nesting sites for Black-Cockatoos. The individual tree locations and heights for some pine trees were not recorded, but given they are in groves and planted at the same time they are mapped.

Tree height was estimated using a range-finder for a couple of the trees in a grove and then those trees were used as a reference to estimate the height of other trees in that grove. For trees with a DBH $\geq 50\text{cm}$, the actual circumference of the tree at breast height was measured.

In 2022 the Commonwealth Department of Agriculture, Water and the Environment (2022) released '*Referral guideline for 3 WA threatened black cockatoo species Carnaby's Cockatoo (Zanda latirostris), Baudin's Cockatoo (Zanda baudinii) and the Forest Red-tailed Black-cockatoo (Calyptorhynchus banksii naso)*'. The criteria for assessing the impacts on Black-Cockatoos contained in this report have been used in this assessment.

Structure of results

The results of the field investigation are reported first as some general and contextual observations under two headings: a) trees; and b) foraging habitat for Black-Cockatoos. This is followed by the provision of information about specific areas. Each of these areas have been marked on Figures B1-17 and C1-9.

Results

Trees

Trees in the project area could be classified as *in-situ* native and non-planted, with the native trees typically being found either in the conservation reserve, in the proposed powerline route or roadside vegetation; groves of planted trees, were mostly in the paddocks. Many of the larger trees, particularly those in paddocks within the project area had been planted, and the majority are non-endemic eucalypts or pine trees. It was also apparent that many of the groves of trees had been planted at about the same time as they were of a very similar height and trunk diameter.

It appears the farmers had planted trees to act as wind breaks, mostly along boundary fences or around contours or as shade trees for sheep and cattle. Many of these trees are young or their structure did not conform with the definition used to define tall trees. There are numerous single or small groves of low trees, that are not considered as 'tall trees' and some have not been mapped in the figures nor have their height and trunk diameters been recorded. In addition, there are small groves of trees (*Eucalyptus tottiana*) in the southern area that have a height of 6-10m and are used as shelter by the stock in those paddocks. These groves of trees contained species that do not typically form hollows nor provide a foraging resource for Black-Cockatoos, and trunks have often grown at oblique angles, so they are of little consequence in a Black-Cockatoo habitat assessment.

Hollows suitable for nesting sites for Black-Cockatoos

We found Marri trees (*Corymbia calophylla*) trees in one area under the proposed transmission line that contained hollows of suitable dimensions to provide a nesting site for Black-Cockatoos. No other area contained trees with suitable hollows for Black-Cockatoo nests.

Tall and significant trees

The location of tall trees, pines and those that might grow to form hollows and provide nesting sites for Black-Cockatoos (i.e. eucalypts with a DBH ≥ 50 cm; i.e. significant trees) are shown in Appendix B and have been mapped in Figure B. Images of the sixty-four significant Black-Cockatoo habitat trees are shown in Appendix C.

Foraging habitat for Black-Cockatoos

It should be noted that our reporting of the upper stratum height of foraging vegetation for Black-Cockatoos in many circumstances is a very poor indication of the foraging habitat and is misleading. Most of the vegetation is at a lower level often with very few plant species growing to a higher level to form the upper stratum.

We found no evidence of Black-Cockatoos foraging in the project area, nor were any Black-Cockatoos seen during the field survey in the project area. However, unless there was heavy foraging in the kwongan heath, it could be difficult to detect foraging particularly on *Hakea* spp. and *Grevillea* spp.. Chewing of banksia infructescences and pinecones is obvious and was not observed and we found no pinecones that had been chewed by Black-Cockatoos.

There were patches of kwongan heath dominated by proteaceous plant species such as *Banksia* spp., *Hakea* spp. and *Grevillea* spp. which is listed as prime foraging habitat for Carnaby's Black-Cockatoo (Johnston 2013, Department of Agriculture Water and the Environment 2022) that have been mapped in Figure C, along with an indication of the maximum height of the upper stratum.

The large pine plantation in the southern part of the project area had been substantially burnt and many of the trees appeared dead. A few of the trees had survived the burn, so there are a few live trees but generally there were none providing foraging value for Black-Cockatoos. The other small pine plantations that were well established, also rated as a 5, although we found no evidence that Black-Cockatoos had foraged on any of the pinecones.

Many of the paddocks had been planted with cereal crops which were beginning to die off and would be ready for harvesting within the coming weeks. A couple of other paddocks had been sown with lupins, which is a low value food for Carnaby's Black-Cockatoo (Groom 2011).

Carnaby's Black-Cockatoo breeding

There was no evidence to indicate that Carnaby's Black-Cockatoo was breeding in or near the project area. However, the owner of Ejeed Pty Ltd farm indicated that Carnaby's Black-Cockatoos used to breed every year in the very old trees along a creek line on his property, but they had been displaced by the Little Corella. We observed a large number of Little Corella breeding in the trees along the creek line.

Tree and foraging habitat data

Areas other than paddocks in fallow, with wheat or lupin crops or providing little if any foraging habitat for Black-Cockatoos have not been marked on Figure C. Areas that provide potential foraging habitat are marked on Figure C. Habitat assessment for the various areas described below are linked to Figure B.

Area 1

Habitat: Kwongan heath, high quality
Upper stratum height: 2.5m
Rating: 8
Comment: Roadside disturbance

Area 1

Discussion

There is a recorded Carnaby's Black-Cockatoo breeding site between 8-20km north-east of the project area and an abundance of mature Marri and Wandoo trees along a creek line approximately 10km south of the project area that also provides nesting opportunities for this cockatoo. If Black-Cockatoos are breeding in these locations, then the Kwongan heath and Marri trees in the project area is within easy flying range as a food resource when raising chicks.

Fauna habitats in the assessed area can be categorised as:

- Kwongan heath, which was largely undisturbed, even in areas adjacent to roads and tracks, unless a road drainage gully had been cut through the vegetation;
- Grove of Marri trees in close proximity to high quality foraging habitat in the transmission corridor;
- Non-endemic planted paddock trees that have been planted along fence lines or around contours;
- Planted paddock trees, which were groves of trees, some of which had been planted in paddock in fallow presumably to provide shade and protection for sheep and cattle;
- Agricultural crops mostly of wheat and lupins; and
- Fallow paddocks, that had been cleared of almost all native vegetation but had no recent crop, and could have contained an abundance of weeds.

Please contact the undersigned (0407 385 239) or Dr Graham Thompson (0438 491 227) should you have any questions regarding this report.

Yours sincerely

Dr Scott Thompson
Partner and Principal Zoologist

Appendix A. Foraging quality scoring tool template

Starting score	Baudin's Cockatoo	Carnaby's Cockatoo	Forest Red-tailed Black-Cockatoo
10	Start at a score of 10 if your site is native eucalypt woodlands and forest, and proteaceous woodland and heath, particularly Marri, within the range of the species, including along roadsides and parkland cleared areas. Can include planted vegetation. This tool only applies to sites equal to or larger than 1 hectare in size.	Start at a score of 10 if your site is native shrubland, kwongan heathland or woodland, dominated by proteaceous plant species such as <i>Banksia</i> spp. (including <i>Dryandra</i> spp.), <i>Hakea</i> spp. and <i>Grevillea</i> spp., as well as native eucalypt woodland and forest that contains foraging species, within the range of the species, including along roadsides and parkland cleared areas. Also includes planted native vegetation. This tool only applies to sites equal to or larger than 1 hectare in size.	Start at a score of 10 if your site is Jarrah or Marri woodland and/or forest, or if it is on the edge of Karri forest, or if Wandoo and Blackbutt occur on the site, within the range of the subspecies, including along roadsides and parkland cleared areas. This tool only applies to sites equal to or larger than 1 hectare in size.
Attribute	Sub-tractions	Context adjustor (attributes reducing functionality of foraging habitat)	
Foraging potential	-2	Subtract 2 from your score if there is no evidence of feeding debris on your site.	Subtract 2 from your score if there is no evidence of feeding debris on your site.
Connectivity	-2	Subtract 2 from your score if you have evidence to conclude that there is no other foraging habitat within 12 km of your site.	Subtract 2 from your score if you have evidence to conclude that there is no other foraging habitat within 12 km of your site.
Proximity to breeding	-2	Subtract 2 if you have evidence to conclude that your site is more than 12 km from breeding habitat	Subtract 2 if you have evidence to conclude that your site is more than 12 km from breeding habitat.
Proximity to roosting	-1	Subtract 1 if you have evidence to conclude that your site is more than 20 km from a known night roosting habitat.	Subtract 1 if you have evidence to conclude that your site is more than 20 km from a known night roosting habitat.
Impact from significant plant disease	-1	Subtract 1 if your site has disease present (e.g. <i>Phytophthora</i> spp. or Marri canker) and the disease is affecting more than 50% of the preferred food plants present.	Subtract 1 if your site has disease present (e.g. <i>Phytophthora</i> spp. or Marri canker) and the disease is affecting more than 50% of the preferred food plants present.
Total score	Enter score	Enter score	Enter score
Appraisal	To support your habitat score, you should provide an overall appraisal of the habitat on the impact site and within 20km of the impact area to clearly explain and justify the score. It should include discussion on the foraging habitat's proximity to other resources (e.g. exact distance to proximate resources), frequency of use of proximate sites, the degree of evidence and description of vegetation type and condition.		

Appendix B. Significant Black-Cockatoo trees (Zone 50, GDA94)

Tree #	Species	Easting	Northing	Tree type	Tree DBH (mm)	Tree height (m)	Hollow entrance size (mm)	Hollow orientation	Hollow height (m)	Hollow type	Photo #	Comment
